

E-CENSUS: POPULATION MONITORING SYSTEM

A project submitted to the Bharathidasan University
in partial fulfillment of the requirements
for the award of the Degree of

BACHELOR OF SCIENCE IN COMPUTER SCIENCE

Submitted by

C.VANISRI
195114636

Under the guidance of
Dr. B. GAYATHRI, MCA, M. Phil, Ph.D.
Assistant Professor

UG DEPARTMENT OF COMPUTER SCIENCE (S.F)
BISHOP HEBER COLLEGE (AUTONOMOUS)

(Nationally Reaccredited at the 'A' Grade by NAAC with the CGPA of 3.58 out of 4)
(Recognized by UGC as "College of Excellence")
(Affiliated to Bharathidasan University)

TIRUCHIRAPPALLI-620 017

APRIL – 2021

DECLARATION

I hereby declare that the project work presented is originally done by me under the guidance of **Dr. B GAYATHRI, MCA, M. Phil, Ph.D. Assistant Professor, PG Department of Computer Science (S.F), Bishop Heber College (Autonomous), Tiruchirappalli-620 017** and has not been included in any other project submitted for any other degree.

Name of the Candidate : C.VANISRI

Register Number : 195114636

Batch : 2019-2022

Signature of the Candidate

Dr. B. GAYATHRI, MCA, M. Phil, Ph. D.

Assistant Professor,

UG Department of Computer Science

(S.F), Bishop Heber College

(Autonomous), Tiruchirappalli – 620 017

Date:

CERTIFICATE

This is to certify that the project work entitled **E-CENSUS: POPULATION MONITORING SYSTEM** is a Bonafide record work done by **C.VANISRI,195114636** in partial fulfillment of the requirements for the award of the degree of **BACHELOR OF SCIENCE IN COMPUTER SCIENCE** during the period **2019 - 2022**.

Place:

Signature of the Guide

UG DEPARTMENT OF COMPUTER SCIENCE (S.F)

ACKNOWLEDGEMENT

First, I am very thankful to the almighty for showering the Blessings throughout my life. I would like to express my heartfelt thanks to my beloved parents who have sacrificed a lot for my future. This support was the foundation stone for my efforts.

I acknowledge my sincere thanks to Dr. D. PAUL DHAYABARAN, M.Sc., M.Phil., PGDCA., Ph.D., Principal, Bishop Heber College (Autonomous), Tiruchirappalli, for giving me the opportunity to do my Undergraduate Degree course in the renowned institution and providing facilities to carry out the project work.

I submit my heartfelt thanks to Dr. J.G.R. SATHIASEELAN, M.Sc., Ph.D., Associate Professor, Co-ordinate of Computer Science, IT & CA, Bishop Heber College, Tiruchirappalli, for his guidance and support in successful completion of the project work.

I am very proud and thankful to Dr. G. SOBERS SMILES DAVID M.C.A., M.Phil., NET., Ph.D., Associate Professor and Head, Department of Computer Science, Bishop Heber College, Tiruchirappalli, for giving me the opportunity to do the course in the college.

I am grateful to Dr. B. GAYATHRI MCA, M.Phil., Ph.D. Assistant Professor, Department of Computer Science (S.F), Department of Computer Science (S.F), Bishop Heber College (Autonomous), Tiruchirappalli, the internal guide for timely suggestions and constant encouragement and support that led to the accomplishment of the project.

I extended my thanks to all faculty members of Department of Computer Science for their support and motivation towards my entire journey of my course.

I wish to express my heartfelt thanks to my friends for their continuous encouragement and assistance right from the beginning to the end of the journey of my project.

C.VANISRI

ABSTRACT

Online Population monitoring technology, over the internet has become an integral part of day to day life. It is a user-friendlier and widely accessible to users. An online census is the web-based application which allows respondents to complete the census via the internet. Government needs to survey the number of people in family and maintains the details with safe and secure. But today no any centralize mechanism with us to identify manpower's of specific type per requirement. So Online Population monitoring system helps to maintain the enumerator details in the database and reduces the workers. In this project helps to ensure the conduct of a good and credible census program throughout the nation. In this project user can register and login the system using his/her user name and password. After the login process he/she can update his/her profile like education, working and age details etc. the overall process is maintain and monitored by admin only. The admin can login the system using his/her username and password. After the login process he/she can view the user details and he/she can search the user details like education, working and age details etc.

1. Project Description

1.1 Introduction

Population and housing censuses provide a wide range of statistical information on the population – persons, households and housing units. They allow detailed disaggregation of data by small geographic areas and small population groups. However, it is widely recognized that conducting a population and housing census is one of the most expensive and complex data collection operations, comprising of a series of many interrelated activities. The logistical effort required, and the difficulties encountered in contacting and collecting information on the whole population within a limited period of time, adds to the complexity. Recent advances in information and communication technology have changed how routine statistical business processes, such as enumeration area (EA) design, data capture and validation, data processing, and data dissemination, are being carried-out. The use of such technology has become an integral part of many census processes critical for improving the cost, quality (coverage, accuracy, timeliness) and efficiency of the census. The rapid expansion in mobile connectivity, and rapid progress in technological innovation more broadly (such as cloud computing, smart mobile devices, GPS, web GIS), provide new opportunities for increasing the quality and speed with which census data can be collected and the statistics produced. Hardware and software as well as mobile data networks are becoming cheaper and better, and infrastructure and capacity that enables effective deployments is increasingly available in all parts of the world. This means that the immense progress in connectivity (in terms of both speed and magnitude) and technology adoption has a large potential for modernizing and complementing traditional statistical collection. New approaches are allowing the collection of data with handheld electronic devices, the Internet and the telephone in a manner that is better, faster and potentially cheaper. The ability of population monitoring systems to instantly transmit data over mobile data networks provide a substantial advantage over more traditional procedures and allows data to be captured, inspected and validated shortly after it is collected, thus improving data quality. The online documentation system acts as the reference site for the network of SGR operators, who use it to access documentation material, such as manuals and legislative references, but also as an up-to-date information site for contents such as wiki and communications.

1.2 Existing System

When the decision about the e-census was taken, it was however clear that, for organizational reasons and due to current Internet coverage, this electronic entry option could not replace the written postal questionnaire but merely complement it. The existing system had some disadvantages like the census made manually, in census data collecting process some information are missing by human error and also that was more time consuming process.

1.3 Proposed System

In proposed system, we will monitor census in easy way. The people just update their information in this website it will store in database. Whenever admin wants to know the census it will appear in front of him by clicking census button. These goals can be achieved only by designing and implementing a flexible architecture, which is based on balanced and replicated systems and uses a consolidated middleware infrastructure where components can be plugged easily and without massive code reworks.

2. Logical Development

2.1.DFDs

A two-dimensional diagram explains how data is processed and transferred in a system. The graphical depiction identifies each source of data and how it interacts with other data sources to reach a common output. Individuals seeking to draft a data flow diagram must identify external inputs and outputs, determine how the inputs and outputs relate to each other, and explain with graphics how these connections relate and what they result in. This type of diagram helps business development and design teams visualize how data is processed and identify or improve certain aspects.

Data flow Symbols:

Symbol	Description
	An entity . A source of data or a destination for data.
	A process or task that is performed by the system.
	A data store , a place where data is held between processes.
	A data flow .

LEVEL 0

DFD Level 0 is also called a Context Diagram. It's a basic overview of the whole system or process being analyzed or modeled. It's designed to be an at-a-glance view, showing the system as a single high-level process, with its relationship to external entities. It should be easily understood by a wide audience, including stakeholders, business analysts, data analysts and developers.

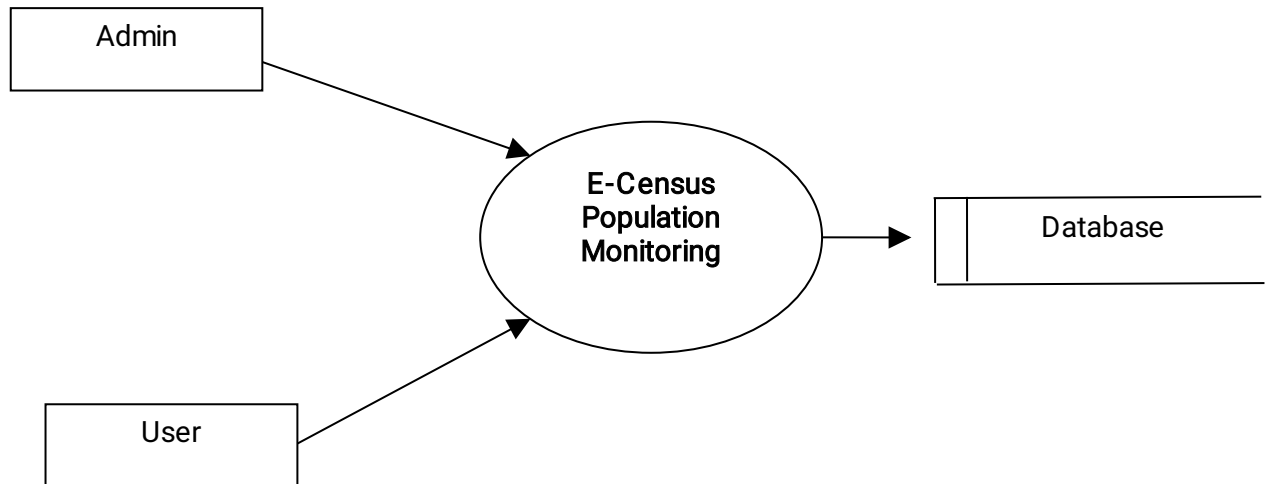

Fig 2.1 DFD level 0

LEVEL 1

DFD Level 1 provides a more detailed breakout of pieces of the Context Level Diagram. You will highlight the main functions carried out by the system, as you break down the high-level process of the Context Diagram into its sub – processes. A level 1 data flow diagram (DFD) is more detailed than a level 0 DFD but not as detailed as a level 2 DFD. It breaks down the main processes into sub processes that can then be analyzed and improved on a more intimate level.

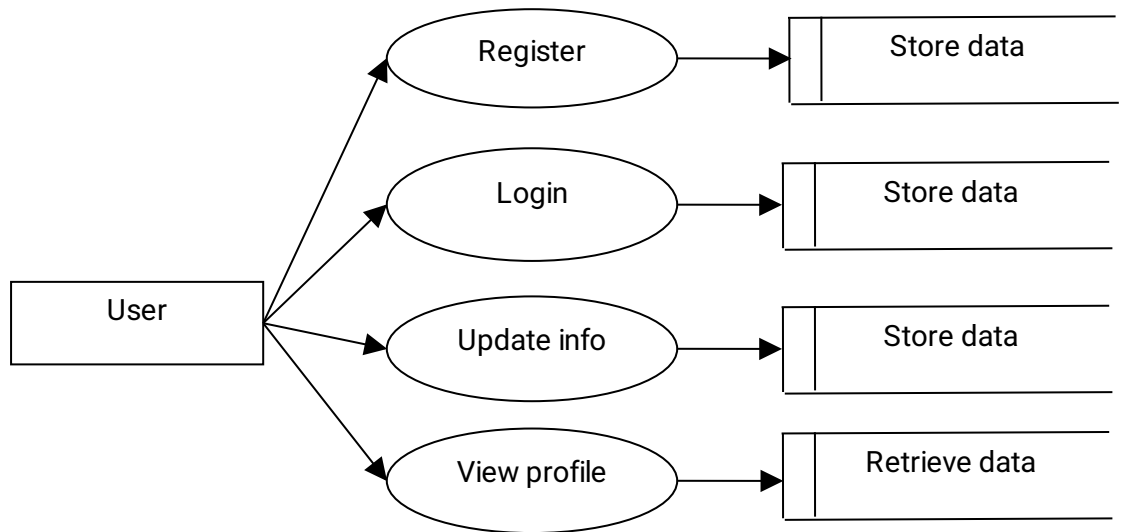

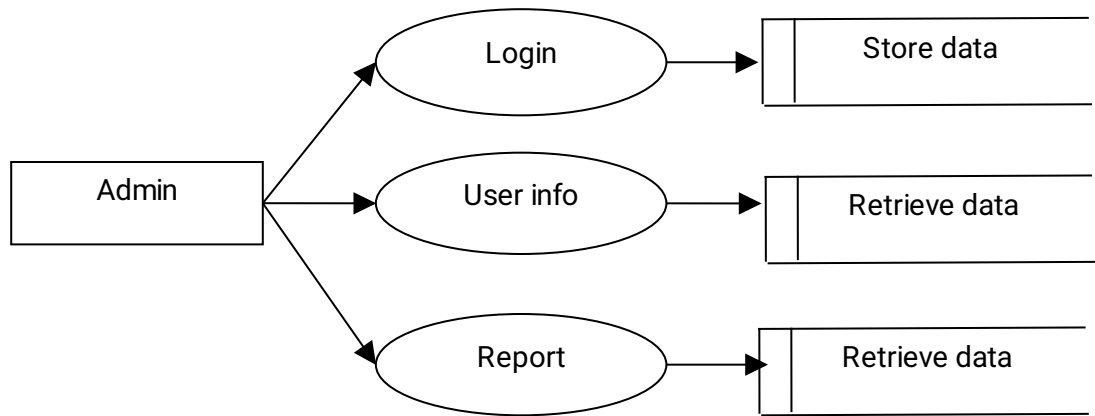

Fig 2.2 DFD level 1

2.2. Architectural Design

A system architecture or systems architecture is the conceptual model that defines the structure, behavior, and more views of a system. An architecture description is a formal description and representation of a system, organized in a way that supports reasoning about the structures and behaviors of the system. System architecture can comprise system components, the externally visible properties of those components, the relationships (e.g. the behavior) between them. It can provide a plan from which products can be procured, and systems developed, that will work together to implement the overall system. There have been efforts to formalize languages to describe system architecture; collectively these are called architecture description languages (ADLs).

Various organizations define systems architecture in different ways, including:

- An allocated arrangement of physical elements which provides the design solution for a consumer product or life-cycle process intended to satisfy the requirements of the functional architecture and the requirements baseline.
- Architecture comprises the most important, pervasive, top-level, strategic inventions, decisions, and their associated rationales about the overall structure (i.e., essential elements and their relationships) and associated characteristics and behavior.
- If documented, it may include information such as a detailed inventory of current hardware, software and networking capabilities; a description of long-range plans and priorities for future purchases, and a plan for upgrading and/or replacing dated equipment and software.

An architecture diagram is a graphical representation of a set of concepts that are part of architecture, including their principles, elements and components. Architecture diagram can help system designers and developers visualize the high-level, overall structure of their system or application, in order to ensure the system meets their users' needs. Using architecture diagram, you can also describe patterns that are used throughout the design. It's somewhat like a blueprint that you use as a guide, so that you and your colleagues can discuss, improve and follow.

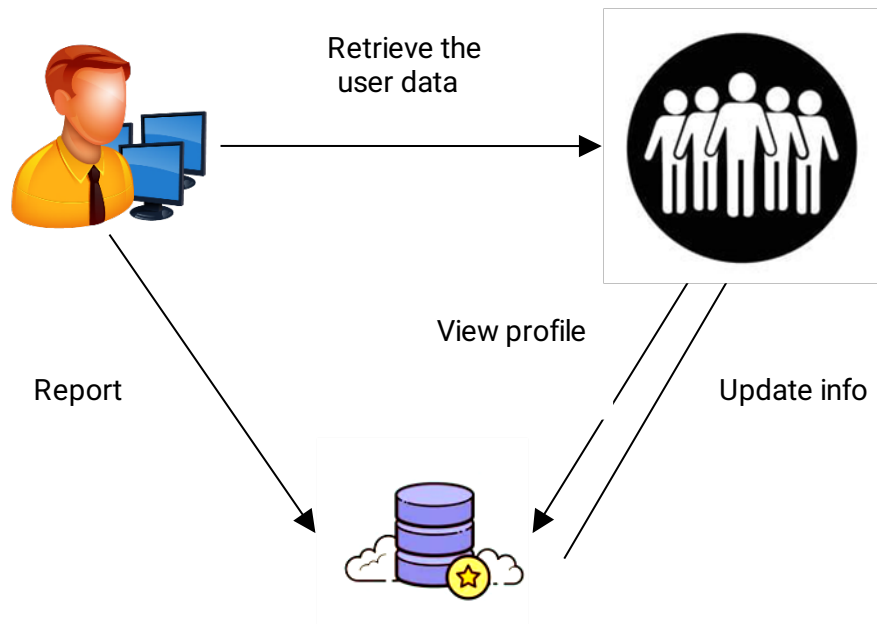

Fig 2.2.1 Architecture Diagram

3. Database design

3.1. Data Dictionary

Field	Description	Example
id	id	4577
uname	Username	siva
education	Education	pg
birth	Date of birth	1-2-1995
age	Age	25
gender	Gender	female
anual_income	Annual Income	1,20,000
occupation	Occupation	Bank officer
language	Language known	Tamil
marital_status	Marital status	unmarried
household	Household	3
family	Family	Nuclear
image	User image	Image.jpg
email	Email address	siva@gmail.com
address	Address	trichy
contact	Phone number	8455554587
password	password	****

3.2. Tables Design

3.2.1 User registration

Field	Type	Null	Default
id	int(100)	Yes	NULL
name	varchar(100)	Yes	NULL
contact	varchar(100)	Yes	NULL
email	varchar(100)	Yes	NULL
address	varchar(100)	Yes	NULL
username	varchar(100)	Yes	NULL
password	varchar(100)	Yes	NULL
status	varchar(100)	Yes	NULL
report	varchar(100)	Yes	NULL

3.2.2 User Profile

Field	Type	Null	Default
id	int(100)	Yes	NULL
uname	varchar(100)	Yes	NULL
education	varchar(100)	Yes	NULL
birth	varchar(100)	Yes	NULL
age	varchar(100)	Yes	NULL
gender	varchar(100)	Yes	NULL
anual_income	varchar(100)	Yes	NULL
occupation	varchar(100)	Yes	NULL
language	varchar(100)	Yes	NULL
marital_status	varchar(100)	Yes	NULL
household	varchar(100)	Yes	NULL
family	varchar(100)	Yes	NULL
image	varchar(100)	Yes	NULL
status	varchar(100)	Yes	NULL
report	varchar(100)	Yes	NULL

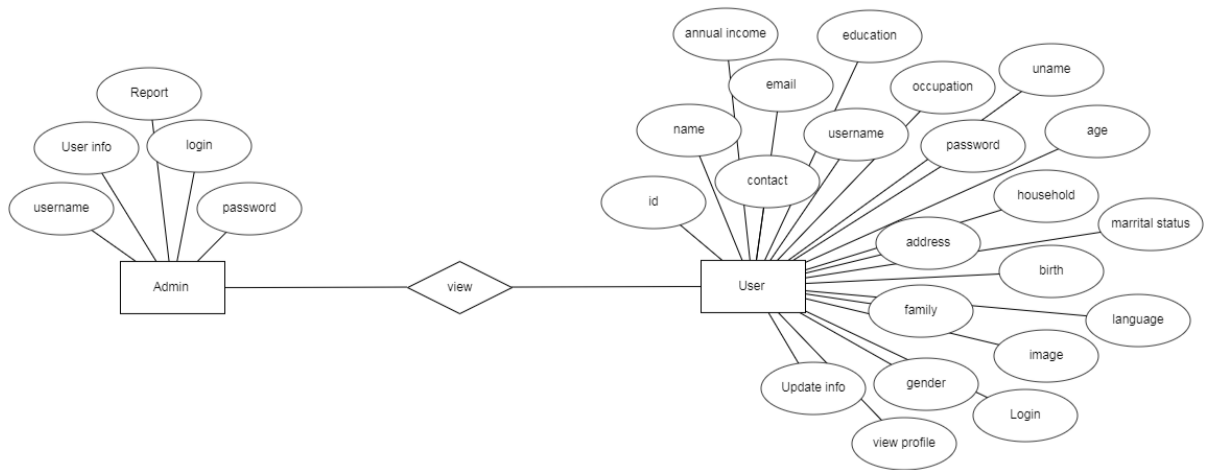

Fig 3.3 ER diagram

4. Program Design

Program design is the activity of progressing from a specification of some required program to a description of the program itself. Most phase models of the software life cycle recognize program designs one of the phase. The input to this phase specification of what the program is required to do. During the phase the design decisions are made as to how the program will meet these requirements, and the output of the phase is a description of the program in some form that provides a suitable basis for subsequent implementation.

The project has the following modules,

Admin

- Login
- User info
- Report

User

- Register
- Login
- Update info
- View Profile

Modules Description

Admin login

Admin is the super user of the system. Admin will manage and maintain the entire systems which are added. Admin have a unique username and password. Thus using it admin will login into the system.

User info

Admin can view the user using his/her email id. Enter the emailed and give submit, it can view the details of that user such as education, birth, marital status, occupation ,etc.

Report

In this module admin can view the important details of whole users who has updated their information such as id, name, emailid, contact and address.

Register

In register module users are register here to create username and password to login the system using name, email, contact, username and password.

Login

Users have unique username and password who had register. Give their username and password to login into the system for update and edit the details.

Updated info

In updated info module user can create a profile using their personal details such as education, birth, age, gender, occupation, language, marital status ,etc.

View profile

In this module user can view the created profile. Then if any informations are wrong or incorrect in created profile user can edit the details using edit button.

5. Testing

Testing

Testing is a series of different tests that whose primary purpose is to fully exercise the computer based system. Although each test has a different purpose, all work should verify that all system element have been properly integrated and performed allocated function. Testing is the process of checking whether the developed system works according to the actual requirement and objectives of the system. The philosophy behind testing is to find the errors. A good test is one that has a high probability of finding an undiscovered error. A successful test is one that uncovers the undiscovered error. Test cases are devised with this purpose in mind. A test case is a set of data that the system will process as an input.

System testing

After a system has been verified, it needs to be thoroughly tested to ensure that every component of the system is performing in accordance with the specific requirements and that it is operating as it should including when the wrong functions are requested or the wrong data is introduced.

Testing measures consist of developing a set of test criteria either for the entire system or for specific hardware, software and communications components. For an important and sensitive system such as an electronic voting system, a structured system testing program may be established to ensure that all aspects of the system are thoroughly tested.

Testing measures that could be followed include:

- Applying functional tests to determine whether the test criteria have been met
- Applying qualitative assessments to determine whether the test criteria have been met.
- Conducting tests in “laboratory” conditions and conducting tests in a variety of “real life” conditions.
- Conducting tests over an extended period of time to ensure systems can perform consistently.
- Conducting “load tests”, simulating as close as possible likely conditions while using or exceeding the amounts of data that can be expected to be handled in an actual situation.

Test measures for hardware may include:

- Applying “non-operating” tests to ensure that equipment can stand up to expected levels of physical handling.
- Testing “hard wired” code in hardware (firmware) to ensure its logical correctness and that appropriate standards are followed.

Tests for software components also include:

- Testing all programs to ensure its logical correctness and that appropriate design, development and implementation standards have been followed.
- Conducting “load tests”, simulating as close as possible a variety of “real life” conditions using or exceeding the amounts of data that could be expected in an actual situation.
- Verifying that integrity of data is maintained throughout its required manipulation.

Unit testing

The first test in the development process is the unit test. The source code is normally divided into modules, which in turn are divided into smaller units called units. These units have specific behavior. The test done on these units of code is called unit test. Unit test depends upon the language on which the project is developed.

Unit tests ensure that each unique path of the project performs accurately to the documented specifications and contains clearly defined inputs and expected results. Functional and reliability test in an Engineering environment, producing tests for the behavior of components (nodes and vertices) of a product to ensure their correct behavior prior to system integration.

Fig 5.1 Unit testing

Integration testing

Testing is which modules are combined and tested as a group. Modules are typically code modules, individual applications, source and destination applications on a network, etc. Integration Testing follows unit testing and precedes system testing. Testing after the product is code complete. Betas are often widely distributed or even distributed to the public at large in hopes that they will buy the final product when it is release.

UPDATE

Fig 5.2 Integrating testing

Validation Testing

Validation testing is testing where tester performed functional and non-functional testing. Here functional testing includes Unit Testing (UT), Integration Testing (IT) and System Testing (ST), and non-functional testing includes User acceptance testing (UAT). Validation testing is also known as dynamic testing, where we are ensuring that "we have developed the product right." And it also checks that the software meets the business needs of the client. It is a process of checking the software during or at the end of the development cycle to decide whether the software follow the specified business requirements. We can validate that the user accepts the product or not.

The screenshot displays a web application interface with a registration form and a validation error message. The error message, titled "localhost says", states "Enter Valid Contact (10 Digit)" and includes an "OK" button. The registration form, titled "Register Now", contains the following fields and values:

Field	Value
Name	mani
Contact	98765432
Email	arun@gmail.com
Address	
Username	
Password	

Below the form is a green "REGISTER" button. The background of the page features a blurred image of a person's head and shoulders.

Fig 5.3 Validation testing

6. Conclusion

In this project, a user friendly and menu driven web application software for the selected E-Census Population Monitoring system has been designed and implemented using php environment. The "E-Census Population Monitoring system" was successfully designed and is tested for accuracy and quality. The developed will be used in searching, retrieving and generating information for the concerned requests. It can be summarizing that the future scope of the project circles around maintaining information regarding: 1.We can add advance software for E-Census Population Monitoring system including more facilities. 2.We will host the platform on online servers to make it accessible worldwide.
